

FreshCart 360

Revenue & Growth

How did sales change from month to month?

Synthetic data. FreshCart is a fictional business.

Business question

Orders grew. Did sales value keep pace?

I calculated monthly GMV and net sales, then separated first purchases from subsequent orders.

The question

Which cities contributed the most to sales?

Analysis workflow

SQL

I aggregated line items before joining to orders, so each order was counted once.

Python

I checked IDs, dates, statuses, and amounts. Invalid records would be set aside for review.

Validation

I reconciled monthly totals against a separate SQL calculation and built charts with year and city filters.

44,472 orders audited. No rows failed validation in this synthetic dataset.

Sales value in 2024 and 2025

Rp billions. GMV precedes discounts and fees; net sales subtract discounts and refunds.

What the 2025 data shows

Rp12.95bn

GMV from 27,644 completed orders.

1,960

customer first purchases.

Jakarta contributed about 43.8% of 2025 GMV. Its larger transaction base does not, on its own, indicate better efficiency.

Next steps and limitations

Metrics to track

I would monitor GMV alongside net sales and active customers. To compare cities fairly, I would also calculate sales per customer.

Data limitation

The generator stops adding new customers near the end of 2025. These charts cannot explain a late-year decline. Promotion impact would require a controlled experiment.
